Country Briefing: United Arab Emirates

Multidimensional Poverty Index (MPI) *At a Glance*

July 2010

This Country Briefing presents the results of the Multidimensional Poverty Index (MPI) and explains key findings graphically. Further information as well as international comparisons are available at www.ophi.org.uk/policy/multidimensional-poverty-index/.

The MPI was constructed by OPHI for the UNDP's 2010 Human Development Report (<http://hdr.undp.org/en/>).

Country Profile

United Arab Emirates-WHS-2003

Country: United Arab Emirates ▼ Year: 2003 Survey: WHS
Region: Arab States

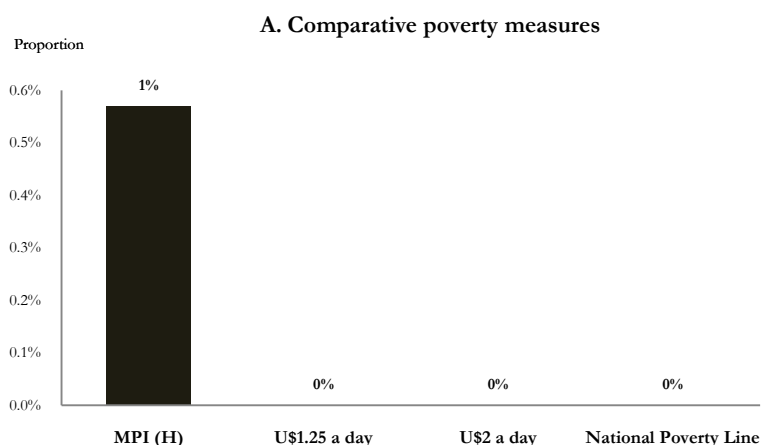

Multidimensional Poverty Index (MPI)

The MPI reflects both the incidence (H) of poverty – the proportion of the population that is multidimensionally poor – and the average intensity (A) of their deprivation – the average proportion of indicators in which they are deprived. The MPI is calculated by multiplying the incidence of poverty by the average intensity across the poor. A person is identified as poor if he or she is deprived in at least 30 percent of the weighted indicators. The following table shows the multidimensional poverty rate (MPI) and its two components: incidence of poverty (H) and average intensity of deprivation faced by the poor (A). The first and second columns of the table report the survey and year which was used to generate the MPI results.

Survey	Year	Multidimensional Poverty Index (MPI = H×A)	Incidence of Poverty (H)	Average Intensity Across the Poor (A)
WHS	2003	0.002	0.6%	35.3%

Comparing the MPI with Other Poverty Measures

Column chart A. compares the poverty rate using the MPI with three other commonly used poverty measures. The height of the first column denotes the percentage of people who are MPI poor (also called the incidence or headcount). The second and third columns denote the percentages of people who are poor according to the \$1.25 a day poverty line and \$2.00 a day poverty line, respectively. The final column denotes the percentage of people who are poor according to the national poverty line. The table on the right hand side reports various descriptive statistics of the country.

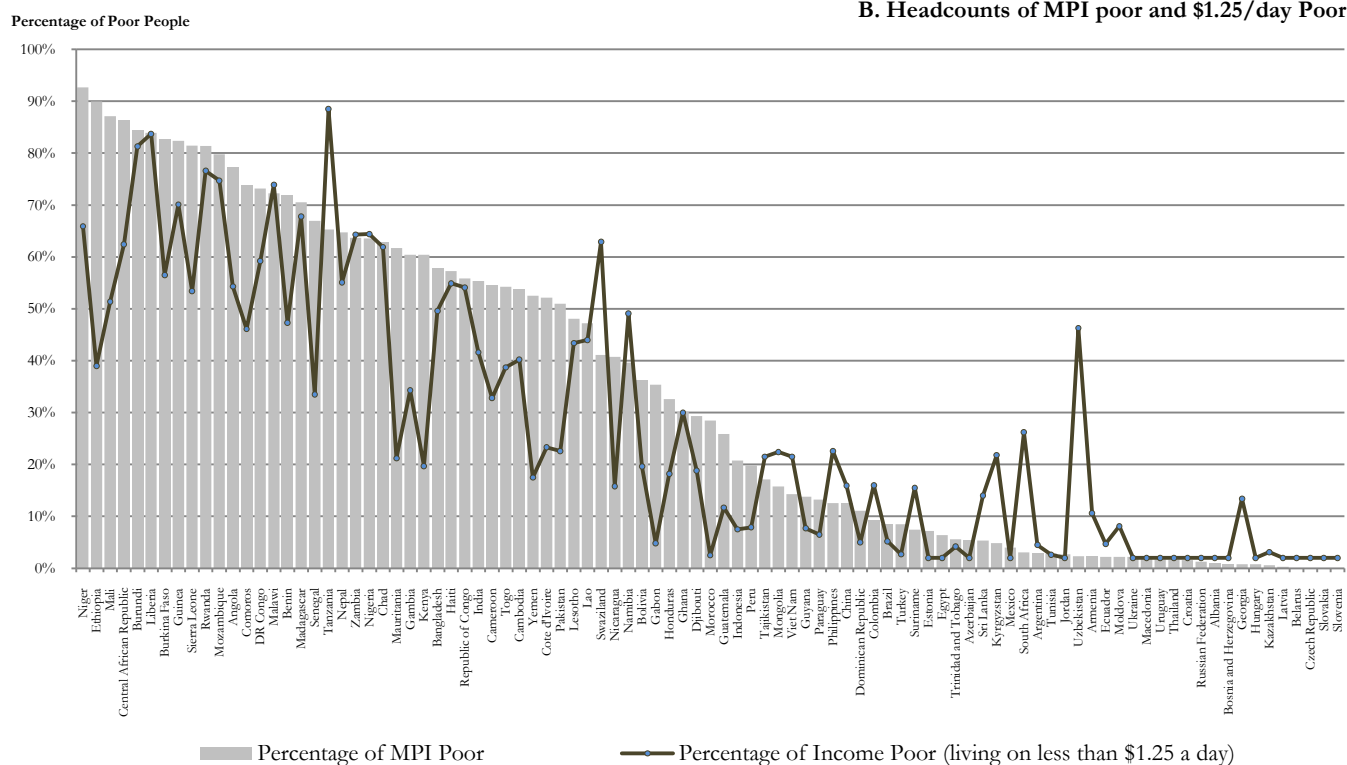

Summary

Multidimensional Poverty Index	0.002
Percentage of MPI Poor (H)	0.006
Average Intensity of Deprivation (A)	0.353
Number of MPI Poor People (in millions)	0.0
Percentage of Income Poor (\$1.25 a day)	0%
Percentage of Income Poor (\$2.00 a day)	0%
Percentage of Poor (National Poverty Line)	0%
Population* (in millions)	4.4
Human Development Index	0.903
HDI rank (104 countries)	86
HDI category	Very High

* Human Development Report 2009, Statistical Annex I.

Comparing the MPI with Other Poverty Measures

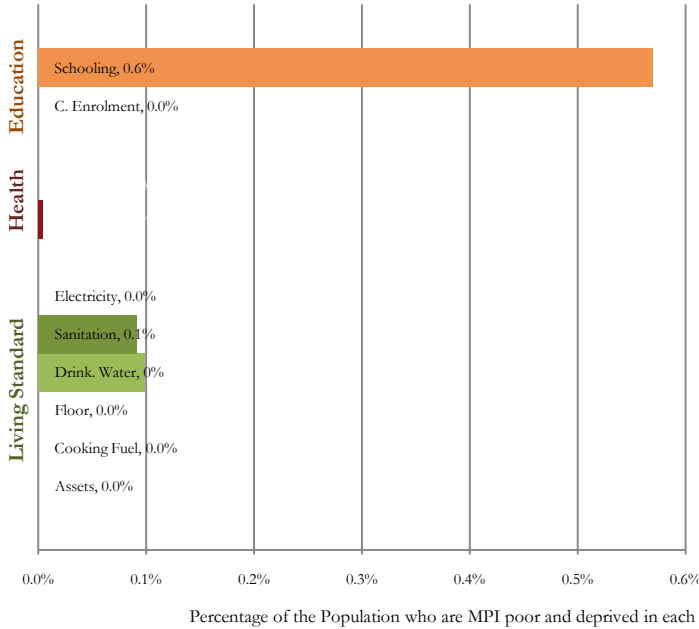

Columnchart B. shows the percentage of people who are MPI poor (also called the incidence or headcount) in the 104 developing countries analysed. The column denoting this country is dark, with other countries shown in light grey. The line across the column chart denotes the percentage of people who are income poor according to the \$1.25 a day poverty line in each country.

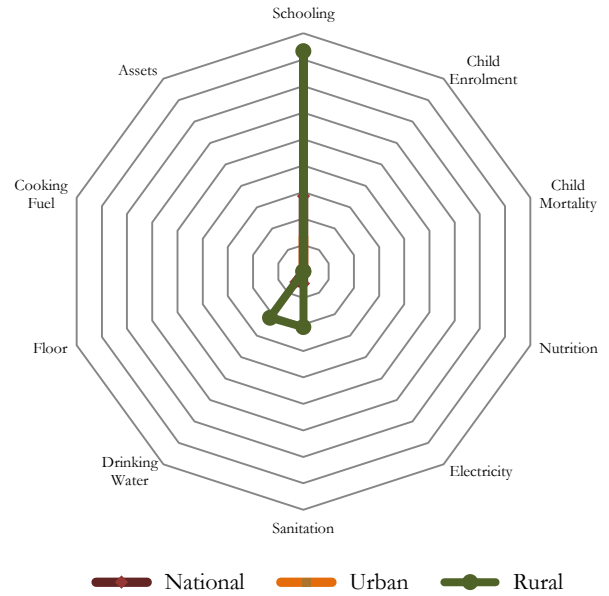

Incidence of Deprivation in Each of the MPI Indicators

The MPI uses 10 indicators to measure poverty in three dimensions: education, health and living standard. The bar chart to the left reports the proportion of the population that is poor and deprived in each indicator. We do not include the deprivation of non-poor people. The spider diagram to the right compares the proportions of the population that are poor and deprived across different indicators. At the same time it compares the performance of rural areas and urban areas with that of the national aggregate. Patterns of deprivation may differ in rural and urban areas.

C. Deprivations in each Indicator

D. Percentage of the Population MPI poor and Deprived

Composition of the MPI

The MPI can be broken down to see directly how much each indicator contributes to multidimensional poverty. The following figure shows the composition of MPI using a pie-chart. Each piece of the pie represents the percentage contribution of each indicator to the overall MPI of the country. The larger the contribution, the bigger is the weighted share of the indicator to the overall poverty.
